Mission & Vision

Everyone knows someone
who's life was touched by cancer.

Help players to find a cure for every disease on earth

We turn players into scientists

Science is a puzzle. We turn the scientific puzzle into a game.

When they play the puzzle, **players contribute to the study.**

As such, they contribute to finding a cure for a disease

Why?

There is more data than scientists can process
Today's Artificial Intelligence is either not trained or
not yet capable to process this data.
Players can be trained to process data
By playing, players can train Artificial Intelligence.

Together we can solve everything!

We are:

UNMASK

www.unmask.nl

Core Team

Dr. Menno van Pelt-Deen

Social Impact game designer at Super Menno Monster & Games for Health. Expert in building bridges between domains by translating scientific queries into playful solutions.

Berry Hermans

Lead developer at Games for Health. Expert in understanding creative and scientific teams involved in developing citizen science games.

Mark van Kuijk

Game producer and co-founder of Games for Health. Expert in leading complex projects with multiple stakeholders.

Jurriaan van Rijswijk

Co founder and sales at Games for Health. Building bridges between industries (Health and Gaming), expert in building professional networks.

It's a proven solution
Citizen Science Games

FoldIT

In six weeks, 10,000 players found a solution to fold proteins that eluded scientists for over a decade.

What is the problem we try to solve?
The science behind Unmask

How do cells grow?

Meet micro RNA150

MICRO RNA 25

Gathering data

Launched through the network of Azerion
eg. Jetztspiele.de

- Over 7.5k players
- Over 30k levels played
- Average playtime 3:22 per level

Analyzing data

- JSON
- Excel/Sheets can't handle it
- Importing in Bigquery and analyse with Lookerstudio
- In progress, but is a game in itself

What are we looking for?

- We test with proven data in the lab
- Initial pass was a string that had too many proven bindings
- added a string with almost no bindings

Potential scenarios

- We see overlap. Great!!
- We see more than overlap. Hmm, let's try that in the lab
- we don't see overlap. Hmm...

Mitigations

- goalseeking and validate (without replay)
- change the game rules (needs replay)

Segment score en aantal keer gespeeld

COUNT van 1 versie RNA

Keep critical

- Test if we can write a bot that plays the game

That's not all

Meet Madelief

She is a unique individual,
with a unique immune system.
Just like anyone else.

Madelief is suffering from lymphoma.

T-Cells do not recognize B-cell cancer.

As a result, the B-Cells continue to multiply.
And lymph-nodes swell and harden.

Research of Dr. Marianne Boes

Binding prediction of current algorithms is not correct.

Her work has shown for 6 patients just like Madelief, that certain unpredicted proteins would cause t-cell production that could kill the cancerous B-cells.

By creating a puzzle game we can:

- Train the algorithm
- Have players create personalized medicine
